## 实验五

## 1. Circle

```
#include iostream
using namespace std;
struct Point
    int x;
    int y;
};
void displayMenu() {
    cout << "********** << endl;
    cout << "***1.Circle****" << endl;</pre>
    cout << "***2. Rectangle*" << endl;</pre>
    cout << "***0.exit******" << endl;</pre>
    cout << "********** << endl;
    cout << "请选择图形: ";
}
int getTwoPoints(struct Point *startP, struct Point * endP) {
    cout << "请确保输入的坐标均为正数!" << endl;
    cout << "请输入起始坐标的(x, y) 坐标: " << endl;
    cin \gg (*startP).x;
    cin >> startP->y;
    cout<<"请输入最终坐标的(x, y)坐标:"<< endl;
    cin >> endP->x;
    cin \gg endP->y;
    if (endP->y \le tartP->y | endP->x \le tartP->x)
        cout << "输入坐标有误,请确保最终坐标比起始坐标大后重新输入!" << endl;
        return 0;
   }
}
//void printPoint(struct startP*) {
//
//}
int drawCircle(struct Point* startP, struct Point* endP) {
    if (endP->x-startP->x!=endP->y-startP->y)
    {
        cout << "您的输入并不是一个圆,请重新输入!" << endl;
        return 0;
```

```
}
    else
    {
        cout << "圆心坐标为: (" << (endP->x +startP->x)/2 << ", " << (endP->y + startP->y)/2
<< ")" << "圆的半径为: " << (endP->x - startP->x) / 2 << endl;
    }
}
int drawRectangle(struct Point* startP, struct Point* endP) {
    if (endP->x - startP->x = endP->y - startP->y)
        cout << "这是一个正方形,它的边长是: " << endP->x - startP->x << endl;
        return 0;
    cout << "长方形的长是: " << endP->x - startP->x << " 宽是: " << endP->y - startP->y <<
endl;
int main() {
    int choice=1;
    struct Point startP, endP;
    while (choice) {
        displayMenu();
        cin >> choice;
        switch (choice)
        case 1:
             if (getTwoPoints(&startP, &endP) != 0) {
                 drawCircle(&startP, &endP);
            };
             system("pause");
             system("cls");
             break;
        case 2:
             if (getTwoPoints(&startP, &endP) != 0) {
                 drawRectangle(&startP, &endP);
             };
             //drawRectangle(&startP, &endP);
             system("pause");
             system("cls");
            break;
        case 0:
             cout << "欢迎下次使用! " << endl;
             exit(0);
             break;
        default:
```

```
cout << "输入错误请重新输入! " << endl;
            system("pause");
            system("cls");
            break;
       }
   }
   return 0;

    □ D:\大一下\c++\课上实验\实验5\Circle\x64\Debug\Circle.exe

                                                                          - 🗆 ×
☑ D:\大一下\c++\课上实验\实验5\Circle\x64\Debug\Circle.exe
5 20
青输入最终坐标的(x, y)坐标:
15 25
您的输入并不是一个圆,请重新输入!
请按任意键继续. . . _ _
```

## 2. Revenue

```
#include<iostream>
#include<iomanip>
using namespace std;
struct Rule
{
```

```
int money;
    int revenue;
};
void printRules(Rule* Rules, int step) {
    cout << endl;</pre>
    cout << "纳税规则如下: " << endl;
    cout << "纳税线\t" << "税率" << endl;
    for (int i = 0; i < step; i++)
         cout << Rules[i].money << "\t" << Rules[i].revenue << endl;</pre>
}
void countRevenue(Rule* Rules, int sum, int step) {
    int upper = 0;
    float revenue = 0;
    for (int i = 0; i < step; i++)
         if (sum>=Rules[i].money)
             upper = i;
    }
    //cout << upper << endl;</pre>
    //revenue += 1.0;
    //cout << revenue << endl;</pre>
    if (sum <= Rules[0].money) {</pre>
         cout << "您的收入是: 0, 应缴所得税: 0.00元。" << endl;
    }
    else
         if (upper==0)
             revenue += (sum - Rules[upper].money) * Rules[upper].revenue * 0.01;
         else
             for (int i = 0; i < upper; i++)
              {
                  revenue += (Rules[i + 1].money - Rules[i].money) * Rules[i].revenue *
0.01;
                  //cout << revenue << endl;</pre>
             revenue += (sum - Rules[upper].money) * Rules[upper].revenue * 0.01;
         }
```

```
cout << "您的收入是: " << sum << ", 应交所得税是: " << revenue << "元。" << endl;
}
int main() {
    int num = 0;
    int step = 0;
